CURRENT SERIAL RECORDS

MARKETING RESEARCH REPORT NO. 854

Historic, archived document

Do not assume content reflects current scientific knowledge, policies, or practices.

PREFACE

This report concerns a year-long study of homemakers' opinions and attitudes about selected meats and meat products. It is one of a group of studies conducted by the Special Surveys Branch, Standards and Research Division, Statistical Reporting Service, to determine consumer reactions to agricultural products. The study was designed to provide guidelines for programs of research, education, and information on meat products and to provide product characteristics that satisfy consumer demand better. The National Live Stock and Meat Board contributed toward the cost of the project and also provided technical assistance on behalf of the meat industry.

The data were collected and tabulated by National Analysts, Inc., Philadelphia, Pa., under contract with the U.S. Department of Agriculture. Preliminary results, based on interviewing from the first quarter, were published as SRS-12 in March 1968.

HIGHLIGHTS

Meat Purchasing

When homemakers buy meat, their first consideration appears to be assurance of good quality, judging by the frequency of replies in a nationwide sample survey in 1967 conducted by the U.S. Department of Agriculture in cooperation with the National Live Stock and Meat Board. None of the four meats focused on in the four-season survey--beef, chicken, fresh pork, or ham--consistently satisfied this requirement among the 3,099 homemakers interviewed.

When homemakers were shown a list of meats and then asked which meats they might want to learn more about to ensure receiving good cuts, they were somewhat more likely to mention beef and fresh pork, though not to the exclusion of other meats. Some homemakers said they would like more information about selecting all of the meats on the list, although a substantial number expressed no interest in learning more about any of them.

Complaints about meat in general or the way it is sold tended to concentrate on packaging. Objections were expressed to prepackaging of meats which conceals waste--fat or bone--on the underside where it cannot be seen at the time of purchase. Some homemakers also volunteered that meat is expensive.

Little interest was expressed in buying meat which is already frozen, even though most homemakers said they sometimes freeze fresh meats at home. Inability to judge the freshness of already frozen meat was most often cited as the basis for reluctance to purchase such meat.

Meat Preparation

A majority of homemakers expressed an interest both in learning more about preparing meats and in trying new recipes. About 3 in 10 said they had actually tried a new recipe for meat in the preceding 3 months. Interest in new recipes focused principally on those for meats reportedly used most--especially ground beef and chicken.

The majority of homemakers reported doing outdoor cooking or barbecuing within the 12-month period prior to the interview; ground beef, beefsteak, wieners, and chicken were favored for this type of activity.

Inspection and Grading

The functions of Government inspection and grading were not altogether clear to respondents. Many assigned the functions of grading to inspection, and vice versa. About half believed that grading of retail meat extends to pork. A majority of homemakers also appeared somewhat confused about USDA grade designations for beef, one example being the impression that USDA Grade A was a familiar designation.

Respondent "Images" of Selected Meats

Beef, the most frequently eaten meat in this study, was characterized by a substantial majority of consumers as tasty, easily digested, versatile, healthful, providing little waste, and not being tiresome. It also scored as well as, or better than, the other meats investigated on all but one of the other characteristics listed--desirability for eating cold.

Part of the versatility attributed to beef appears to derive from the number of different forms available, each of which satisfies varying needs. For example, the majority of homemakers considered ground beef inexpensive, easy to prepare and, along with steak, good to serve in warm weather. They also intimated that oven roasts and steak satisfy prestige desires, and these meats (steak to a lesser extent) are likely to be considered a good choice for guests whose preferences in meat are unknown. Overall, unfavorable characteristics were not likely to be attributed to beef. However, among specific cuts, steak was singled out as expensive.

Chicken, although reportedly not served as frequently as beef, was found to share many of the favorable characteristics attributed to beef, and to be relatively free also from negative associations. The chief disadvantages cited concerned its keeping qualities when raw and being a meat one tires of.

Smoked or cured pork--generally known as "ham" to consumers--was the least frequently consumed of the four meats focused on in this study. It was credited by a majority of homemakers with being tasty and good to eat cold. Many women also rated ham favorably for its keeping qualities, and its suitability for serving in warm weather and to special guests. However, many rated it tiresome and unsuitable for weight watchers.

Fresh pork, although reportedly eaten more often than ham, projected a less favorable image. Although respondents themselves tended to characterize fresh pork as tasty, many may have been unsure that others like its taste, as indicated by their reaction to the idea of serving pork cuts to guests whose preferences are not known. In addition to receiving the unfavorable comments mentioned above for ham, fresh pork was also often considered difficult to digest, not always safe to eat, and to have too much waste. Many also claimed that pork is not good to eat cold and does not keep well before cooking.

The specific question of cholesterol was an apparent enigma to homemakers. Cholesterol was named least often as an important factor in deciding which meat to purchase. Even for fresh pork--which evoked the largest number of negative replies on the issue of cholesterol content--two out of three homemakers did not express an opinion on this topic.

Lamb, which was investigated in this study in less detail than the meats discussed above, was not considered favorably for any of the situations suggested to respondents. When asked directly, some nonusers cited dislike for lamb's flavor or odor. Lack of exposure to lamb in the parental home was also mentioned as a reason for not using this meat.

Analysis by Selected Characteristics

To offset possible seasonal variations in responses due to changes in price or availability of the various meats, the survey was conducted throughout calendar year 1967. Homemakers' replies indicate that season of the year has no particular bearing on opinions about the meats investigated in this survey.

For a number of questions, divergent patterns of replies emerged according to the respondents' background characteristics (some of which are closely interrelated, such as level of education, income group, and age). For example, homemakers at higher education levels were more favorably disposed to selecting meats for their nutritional qualities; along with younger homemakers, they were also more interested in learning how to prepare meats and in acquiring new meat recipes. On the basis of easy digestibility, older homemakers tended to reject ham and fresh pork more frequently in favor of beef and chicken.

Possibly of even greater interest are topics on which homemakers' responses were not differentiated to any extent by background characteristics. For instance, homemakers with varied backgrounds were almost equally likely to reject the idea of purchasing already frozen meat. They were also generally agreed on the importance of being assured of good quality meat and in their ratings of beef, chicken, ham, and fresh pork in this respect. Large proportions of women--whether at higher or lower levels of education and income--gave evidence of confusion in some areas where factual information was asked for. Substantial proportions at all education and income levels said that pork is graded at the retail level and that USDA Grade A was a familiar grade designation for beef; both responses are fallacies.

HOMEMAKERS' OPINIONS ABOUT SELECTED MEATS:
A NATIONWIDE SURVEY

by

Margaret Weidenhamer, Edward M. Knott, and Lorna R. Sherman 1/

INTRODUCTION

This study of homemakers' opinions about selected meats was undertaken to provide insights into ways of planning more adequate programs of research, education, and promotion for the mutual benefit of the consumer and the meat industry.

The findings presented here are based on personal interviews conducted with 3,099 homemakers during 1967. These homemakers represented a cross-section of private households located in both urban and rural areas throughout the 48 conterminous States. Respondents were selected entirely by area probability sampling procedures. Because of the possibility of important variations in responses by season, four waves of interviewing were conducted:

<u>Season</u>	<u>Interviewing periods</u>	<u>Completed interviews</u>
		<u>Number</u>
Winter	Jan. 23, 1967--Mar. 27, 1967	776
Spring	Apr. 21, 1967--June 23, 1967	782
Summer	July 21, 1967--Sept. 27, 1967	778
Fall	Oct. 20, 1967--Dec. 28, 1967	<u>763</u>
Total interviews, all seasons		3099

Within each season of the year, almost all interviewing was conducted during the first 3 weeks of the time period specified above.

1/Miss Weidenhamer and Mr. Knott are with the Special Surveys Branch, Standards and Research Division, Statistical Reporting Service, U.S. Department of Agriculture. Mrs. Sherman is with National Analysts, Inc., Philadelphia, Pa.

Provision was made to ensure a minimum completion rate of 80 percent. This was done by a differential callback procedure whereby urban households--where initial contact was not made--were revisited at least three times (either during different times of the same day or on different days), and rural households were revisited at least two times.

A household drawn into the sample that otherwise may have fit the eligibility requirements for this study was declared ineligible if no meat or chicken was said to be served. The eligible respondent was defined as that person in the household with principal responsibility for the purchase and/or preparation of meat. This definition permitted some male respondents to be included in the study. For reporting convenience, however, terms such as "homemakers" and "women" are used in this report to refer to all respondents, regardless of sex. A complete description of the sampling procedures used and estimates of sampling error for this survey are presented in the appendix.

Communities were classified by size as follows:

Metropolitan--Standard Metropolitan Statistical Areas 2/
(SMSA's) of 1 million or more persons in 1960.

Urban--SMSA's of fewer than 1 million persons.

Rural--Areas not included in SMSA's.

Within both the metropolitan and urban groupings, distinction is made between cities of 50,000 or more persons and their suburbs (other areas within the SMSA's boundaries), in accordance with the sample design. (A more detailed explanation of the distinction between cities and suburbs--zones 1 and 2--appears in the sample design section of the appendix.) For reporting convenience, abbreviated terms are used to describe the community size groupings.

2/A Standard Metropolitan Statistical Area, as defined for census purposes, consists of a county or group of contiguous counties (except in New England) which contains at least one central city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county, or counties, containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central city. In New England, towns and cities are the units used in defining SMSA's.

Households reporting

	<u>Number</u>
<u>Metropolitan</u>	1075
City	648
Suburb	427
<u>Urban</u>	939
City	464
Suburb	475
<u>Rural</u>	1085

Respondents were asked to indicate total annual family income before taxes. Households were then classified in approximately equal-sized groups as follows:

<u>Group</u>	<u>Income</u>	<u>Households reporting</u>
		<u>Number</u>
Lower	Under \$5,000	982
Middle	\$5,000 to \$8,999	1,062
Upper	\$9,000 or more	859

A total of 196 respondents did not answer the income question.

Respondents were also classified according to age, size of family, and level of education.

The regional classification (fig. 1) corresponds to that of the Bureau of the Census with the exception that Maryland, Delaware, and the District of Columbia were grouped with the Northeast rather than the South. A listing of the States included in each of the four regions is shown in the appendix.

The discussion in the text focuses on those results that appeared to contribute most to an understanding of homemakers' opinions about the subject areas covered in this study. Data are discussed with reference to demographic characteristics when results indicate either large differences or slight differences where larger ones might have been expected. For more comprehensive coverage, the reader is directed to the appendix tabulations. Findings by these background characteristics are solely descriptive in nature. The reader is cautioned against assigning any cause-and-effect relationship from these results. Personal characteristics such as age, education, and income levels,

which are highly interrelated, are shown separately--rather than in combination--because of the limitations imposed by the number of respondents in the survey. Findings involving other characteristics such as region and community size may reflect differences arising from properties of these characteristics (climate or population density, for example); or they may reflect differences related to the personal characteristics of their residents. A tabulation showing interrelationships among background characteristics can be found in the appendix.

All tabulations presented in the text are based on the total sample of 3,099 respondents, unless otherwise indicated. These tabulations present only the more pertinent categories and, therefore, may not add to the total responses given for that question. Usually there was one response per respondent, although multiple responses were permitted on some questions. A respondent is counted only once when responses are grouped into a summary category. She may be counted in more than one subcategory within the summary category, however.

In some instances, percentage totals in the appendix tabulations show that certain groups--particularly younger homemakers and those at higher education and income levels--are more inclined than their counterparts to express opinions. Previous studies of this kind by the Statistical Reporting Service indicate that this finding is not unusual. It is problematical, however, whether true differences are being recorded or whether some segments of the population are more expressive than others; it may be a combination of the two.

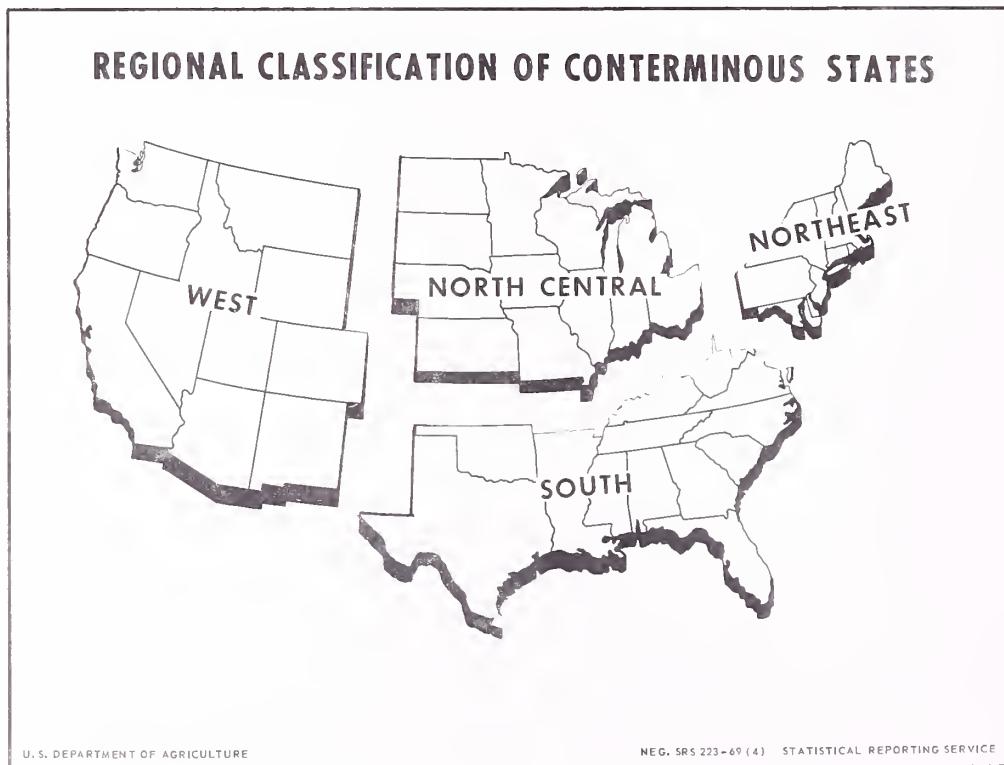

Figure 1

USE OF SPECIFIC MEATS OR MEAT PRODUCTS

The opening questions in the interview were designed to focus on the subject matter of the interview and to categorize respondents as users or nonusers of specific meats. Respondents were also asked to indicate the approximate frequency with which selected meats had been served in the household during the 12 months preceding the interview. These questions were designed to provide background information about the homemakers contacted in this study and to permit classification of households into broad usage groups for analysis of the other data collected. No attempt was made to either verify respondents' definitions of particular meats or to investigate quantities served. Nor does the data on relative frequency of use of various meats indicate the relative amounts consumed. Hence, the data from the questions on meat usage should not be interpreted in quantitative terms. For more precise data about meat consumption, attention is directed to the USDA's 1965 household food consumption study. 3/

Meats Reportedly Served in the Past 12 Months

Almost all homemakers reported using beef and chicken during the 12-month period preceding the interview. Pork and pork products were reported served in slightly fewer homes than were beef or chicken. (Questions 1 and 2) Almost all respondents also claimed that beef, fresh pork, and ham had been served in the parental home. (Question 79--Tabulations not shown) Veal and lamb were said to have been served by only about one-third of all homemakers. (Questions 1 and 2)

Beef and Specific Beef Cuts

Only 17 homemakers in the total sample reported no beef served in the past 12 months. Approximately 9 out of 10 homemakers said some kind of beef was served two or more times a week, on the average. (Question 4)

Ground beef was claimed to be served more frequently than any other cut of beef investigated, followed by steak--cut and definition remaining at the discretion of the respondent. Although 8 out of 10 homemakers reported using both oven and pot roasts, these meats were not served nearly as often as ground beef and steak. (Question 3)

There was some variation in the frequency with which beef and specific cuts of beef were reported served when viewed in terms of respondents' characteristics. Beef was said to be served less frequently by less well educated homemakers and those in lower income homes. According to homemakers' reports, ground beef--the type of beef consumed most frequently--was served somewhat less often by older homemakers and those in small households.

3/Food Consumption of Households in the United States (Northeast, North Central, South, West), Spring 1965. U.S. Dept. Agr., Household Food Consumption Surv. 1965-66, Rpt. 1-5. (Other reports in this series are forthcoming.)

It is interesting to note that family income did not make an appreciable difference in the frequency of serving ground beef. For steak there was a direct relationship between reported family income and consumption; as income rose so did reported frequency of serving.

To help analyze later data, frequency-of-use categories have been established for beef (the 17 nonusers are excluded) as shown below.

		<u>Number</u>
Higher usage	Two or more times a week	2,671
Lower usage	Once a week or less often	410

Frequency-of-use categories have also been established for chicken, fresh pork, and ham; these categories are shown in the usage section for each meat.

The few respondents (3 percent) who said they did not serve beef at all or served it once a month or less often were asked why. The most frequent reasons given by both infrequent and nonusers of beef were that it is too expensive or they preferred other foods. (Questions 5 and 6--Tabulations not shown)

Chicken

Chicken, although reported used in the past 12 months by about as many homemakers as beef, was said to be used somewhat less frequently than beef. (Question 7)

Chicken was reported served at least once a week, on the average, by about 6 homemakers in 10; this proportion includes roughly 2 in 10 who claimed to serve chicken two or more times a week. Frequency-of-usage categories for chicken (excluding the 52 nonusers) include:

		<u>Number</u>
Higher usage	Once a week or more	1,825
Lower usage	Two or three times a month or less	1,222

Pork and Pork Products

For purposes of this study, pork was separated into three categories: (1) bacon; (2) other kinds of smoked or cured pork; and (3) fresh pork. Although these meats were reportedly used by the vast majority of homemakers in the past 12 months, they were not consumed with equal frequency. Bacon was reported used most frequently by homemakers, and other kinds of smoked or cured pork least often.

Bacon was reported to have been used in the past 12 months by almost as many homemakers (95 percent) as said they used beef or chicken. The majority (6 homemakers in 10) said they usually served bacon at least two or three times a week. Bacon was reported served this often by a higher proportion of homemakers in the South than in other regions of the country.

The reasons most frequently offered by homemakers for nonuse or infrequent use of bacon (once a month or less often) were related to health. In some cases it was reported that a physician had prohibited its use. Many of the infrequent users said bacon is too expensive, and some who considered it solely as a breakfast meat said they used little of it because of their personal breakfast habits. (Questions 14 and 15)

Nine out of 10 homemakers reported serving fresh pork in the past 12 months, but only about 3 in 10 said fresh pork was served at least once a week. Of the specific cuts included in this study, pork chops were said to have been served in many more homes--and considerably more frequently--than either pork roast or spareribs. Small households were somewhat less likely to use fresh pork than were medium or large households. The reported incidence and frequency of consumption of fresh pork declined as the age of the respondent increased. (Questions 23 and 26) Categories for frequency of usage of fresh pork are shown below:

		<u>Number</u>
Higher usage	Once a week or more	1,040
Medium usage	Two or three times a month	860
Lower usage	Once a month or less	917
Nonusage	Not at all in past 12 months	282

According to reports of both infrequent users (once a month or less often) and nonusers of fresh pork, health considerations such as digestibility were the most compelling barriers to use of this meat. Both infrequent and nonusers were also likely to cite dislike of pork or preference for other meats as inhibiting use of pork. Price and the grease or fat content of pork appeared to be considerations for some persons in low level usage categories.

Only a small proportion of respondents volunteered reasons related to fear about the safety of eating pork, and very few specifically mentioned danger of trichinosis as a reason for using little or no fresh pork. (Questions 24 and 25)

Reasons cited for infrequent or nonusage of fresh pork by:

	<u>Infrequent users</u>	<u>Nonusers</u>
- - - - - <u>Percent</u> - - - -		
<u>Health reasons</u>	44	60
Hard to digest	13	16
Doctor's orders	7	16
Danger of trichinosis	2	2
<u>Preference</u>	26	20
<u>Too expensive, can't afford it</u>	18	6
<u>It's greasy, fatty</u>	13	12
<u>Safety considerations</u>	5	3
Not safe in warm weather	4	1
Not safe to eat	2	1
- - - - - <u>Number</u> - - - -		
Respondents using little/no fresh pork	917	282

About as many homemakers (9 in 10) reported using smoked (or cured) pork (other than bacon) in the past 12 months as reported using fresh pork. It was said to be used far less frequently than fresh pork, however, as mentioned previously; fewer than 2 in 10 reported using smoked pork as often as once a week. Among the types of smoked or cured pork included in this study, ham (not canned) was said to be used by about three-quarters of all homemakers, while about half of the women reported having used either picnics or canned ham. (Questions 16 and 19)

The frequency-of-usage categories established for smoked pork are shown below:

		<u>Number</u>
Higher usage	Once a week or more	487
Higher medium usage	Two or three times a month	739
Lower medium usage	Once a month	679
Lower usage	Less than once a month	842
Nonusage	Not at all in past 12 months	352

Reasons cited for serving hams or picnics once a month or less often were spread fairly evenly among cost, dislike for the taste or preference for other meats, inability to purchase the size required, waste (nonuse of leftovers), and health reasons. Health reasons were more prominent and waste was less prominent in the explanations given by nonusers, but generally the reasons cited were similar to those given by infrequent users. (Questions 17 and 18)

Reasons cited for infrequent or nonusage of smoked pork by:

	<u>Infrequent users</u>	<u>Nonusers</u>
	- - - - - <u>Percent</u> - - - - -	
Too expensive; can't afford it	29	19
I (we) don't like it, I (we) prefer other meats	27	26
Not available (generally--in the size I need)	23	20
Leftovers not used up	19	2
Health reasons	17	29
	- - - - - <u>Number</u> - - - - -	
Respondents using little/no smoked pork	1,521	352

Domestic and Imported Canned Ham

When users of canned ham were asked if the canned ham they usually buy is imported or not, a majority (58 percent) said they generally buy domestic rather than imported ham; about 1 in 4 said she didn't know. (Question 22)

To determine whether or not canned ham users would be correct in designating the ham they buy as imported or domestic, users were first asked to state the name of the brand they usually bought. The purveyors of canned ham, through the National Live Stock and Meat Board and the American Meat Institute, supplied lists of brand names designating those that were imported and those that were domestic so that conversion of the brand names into the two categories could be accomplished. The following table indicates actual origin of the canned ham mentioned in relation to each respondent's opinion of origin, omitting replies of those who either did not indicate origin or whose answers could not be coded.

Respondent's opinion that canned ham usually bought is:

<u>Respondent's opinion of canned ham's origin is:</u>	<u>Imported</u>	<u>Domestic</u>
- - - - - <u>Percent</u> - - - - -		
Correct	73	97
Incorrect	27	3
- - - - - <u>Number</u> - - - - -		
Respondents naming brand and origin of canned ham usually used	166	649

Contrary to what might have been expected, the data indicate that women claiming to buy domestic ham were more likely to be correct than those who said they usually buy imported ham. Almost all who said they bought domestic canned ham were correct, while one-fourth of those who claimed that they purchased imported ham were actually buying domestic ham.

Lamb

About 1 out of 3 homemakers reported serving lamb in the 12 months prior to the interview. Higher proportions of those in the upper income bracket and those living in the Northeast and West, and in urban areas, tended to use it. Almost half of the users served lamb less often than once a month. (Question 8)

Half of those claiming they served lamb once a month or less often and two-thirds of the nonusers said they did not care for lamb--some specifically mentioning the flavor and some the odor. Many infrequent users also said it is too expensive, and some mentioned availability was a problem. Some nonusers cited lack of exposure, particularly in the parental home, as a reason for not serving this meat. (Questions 9 and 10)

MEAT PURCHASING PRACTICES

Packaging

Toward the end of the interview, respondents were given an opportunity to express dissatisfactions about meat or the way it is sold. They were asked about any objection they might have either to meat in general or to a particular meat. Although no one meat was singled out, complaints were voiced by roughly 3 homemakers in 4. The criticisms were most frequently directed at prepackaged meat and the price of meat. Some homemakers indicated that they would prefer that meat not be prepackaged. Some said packaging was deceptive in that it hid waste--meat was good on top where it could be seen and waste was hidden underneath. Others appeared to be expressing much the same idea when they said packaging tended to prevent their seeing what they were buying. (Questions 73-75--Tabulations not shown)

Complaints about meat:	<u>Percent</u>
<u>Packaging</u>	41
Deceptive	18
Prevents seeing the meat	17
Should not be prepackaged (unspecified)	17
<u>Price</u>	20
<u>Preparing and handling</u>	11
<u>Freshness</u>	9
<u>Waste</u>	8

The complaints about packaging appear to be based on personal experience, rather than hearsay, since 4 out of 5 homemakers said they bought prepackaged meat. Respondents were asked:

"Do you buy prepackaged meat, meat that is either cut or weighed out to order, or do you buy it both ways?"
(If "both ways") "Which way do you usually buy it?"

(Questions 44 and 45)

Way in which meat is purchased:	<u>Percent</u>
<u>Prepackaged only</u>	28
<u>Both ways</u>	53
Usually prepackaged	27
Usually cut to order	17
Both equally	9
<u>Cut to order only</u>	17

Price Specials

Six out of 10 respondents indicated that price specials exerted an influence on their meat purchases. For about one-third of all homemakers, such specials appear to have been a highly important purchase determinant. On the other hand, 2 in 10 said that price specials never influenced what was bought.

Respondents were asked:

"In buying meat, do you shop for 'specials' most of the time, some of the time, only once in a while, or never?"

(Question 46)

	<u>Percent</u>
Most of the time	34
Some of the time	26
Only once in a while	19
Never	21

Shopping for specials appears to be more important among women representing larger households.

Desire to Learn More About How to Select Good Meat

Respondents were asked which meats they would like to learn more about selecting. They were handed a list of meats (Card G) and were asked:

"...for which, if any, would you like to learn more about how to make sure you are getting good meat? Any others?"

(Question 64)

Although homemakers did not select any particular cut of meat to the exclusion of others, they did tend to choose various cuts of beef and fresh pork slightly more often than other cuts. About 3 respondents in 10 expressed no interest in learning more about judging the meats available to them; almost as many said they would like to learn more about selecting all of the meats on the list. Although it is unlikely that this response could be taken literally, it does seem to indicate interest in learning more about many of the meats. Older homemakers were much more likely than younger ones to reject the idea of learning more about meat selection.

Analysis indicates that frequency of usage contributes little to a desire to learn more about judging the quality of a particular meat. Although non-users of a specific meat indicated significantly less interest than users in learning more about judging the quality of that meat, users of the meat indicated approximately the same interest in learning more about judging that meat, regardless of the frequency with which they had reported serving it in the past 12 months. (Frequency-of-usage tabulations not shown)

MEAT PREPARATION

Oven Roasting

Respondents who claimed to use lamb, ham, and pork roasts were asked:

"At what oven temperature do you (roast lamb?) (bake ham?) (roast pork?)" (Questions 11, 20, 27--Tabulations not shown)

About half the respondents who roasted these meats said they used a moderate oven (350 to 375 degrees) for each of them. Most of the remainder reported lower oven temperatures. Very few reported using a hot oven.

<u>Oven temperature when roasting</u>	Lamb	Ham	Pork
- - - - <u>Percent</u> - - - -			
275 degrees or less	3	6	4
300 to 325 degrees	30	32	30
350 to 375 degrees	50	49	49
400 degrees or more	5	5	7
Don't know, no answer	12	8	10
- - - - <u>Number</u> - - - -			
Respondents roasting meat	697	2366	1894

Homemakers who roasted lamb were asked about the degree of "doneness" to which it was cooked. Very few (5 percent) reported serving it rare or medium rare; the majority (64 percent) said it was most often served well done. The remaining women were equally divided between those who said they roasted lamb either medium or medium well. (Question 12--Tabulation not shown)

Approximately 9 out of 10 respondents said they have a temperature control or thermostat on their ovens. Relatively few (17 percent) reported that they usually used a meat thermometer when roasting meats. Reported usage of such a thermometer was higher among those with better education and higher income. (Questions 80, 81)

Outdoor Cooking

More than half of all homemakers (57 percent) said they had done some outdoor cooking in the 12 months prior to their being interviewed. Upper and middle income women, better educated women, those from families with three or more persons, and those under 50 were far more likely to report outdoor cooking than women with lower incomes, less education, aged 50 or over, and living in small households. Suburban homemakers were somewhat more likely to mention outdoor cooking than city dwellers or those in rural areas. (Question 57)

Meats most often said to have been used for outdoor cookery were ground beef, steak, wieners, and chicken. (Question 58--Tabulations not shown)

<u>Meats cooked outdoors</u>	<u>Percent</u>
Ground beef	80
Steak (beef)	76
Wieners, franks, hot dogs	72
Chicken	63
Spareribs	35
Pork chops	18
Ham or picnics	7

Number

Respondents who reported doing outdoor cooking .. 1,753

New Meat Recipes

When homemakers were asked if they had tried any new recipes for meat in the 3 months preceding the interview, replies tended to indicate that active interest in learning new ways to cook meats was somewhat limited.

Respondents were asked:

"In the past 3 months, have you or have you not tried any new recipes for preparing beef, pork, chicken, or any other meat?" (Question 59)

Only 30 percent said they had tried new recipes. Those who said they had were more highly educated and from higher income homes. Younger homemakers, as well as those from the West, appeared more likely to try new recipes.

Sources of new recipes were most often relatives or friends, magazines, cookbooks, and newspapers; the recipes were most often for beef (68 percent) or chicken (53 percent). (Questions 61 and 60--Tabulations not shown)

When homemakers were asked about their interest in learning more about cooking meats and the likelihood of their actually trying new meat recipes, the majority replied affirmatively. After the respondents had indicated their recent experience--or lack of it--with new meat recipes, they were handed a list of meats (Card G) and asked:

"Would you or would you not like to learn more about cooking any of these meats?" (Question 62)

"For which, if any, would you be likely to try new recipes?" (Question 63)

The most frequent replies are presented below:

Homemakers who said they would:

	<u>Like to learn more about cooking</u>	<u>Be likely to try new recipes for cooking</u>
----- <u>Percent</u> -----		
Ground beef	19	31
Chicken	18	28
Stew beef	15	16
Pot roast of beef	15	15
Oven roast of beef	14	13
Steak	12	12
All of them	19	12
None of them	38	30

Interest was centered on ground beef and chicken, not especially as meats respondents would like to learn more about cooking, but--by a wide margin--as meats they might be likely to try new recipes for when cooking. Moreover, both ground beef and chicken were favored by homemakers who said they had tried new recipes in the past 3 months. For both meats, less interest in trying new recipes was expressed by older homemakers, those with small families, and by women at lower income and educational levels. For the other meats on the list, about equal proportions of respondents expressed interest in learning more about cooking and in trying new recipes.

Among those who reported serving a specific cut of meat, the frequency with which it was used generally did not seem to influence interest in learning more about cooking that meat or the likelihood that new recipes would be tried. The one exception was ground beef. The more frequently it was said to be served, the greater was the likelihood that interest would be expressed. (Meat usage cross tabulation not shown)

It is noteworthy that 4 out of 10 homemakers indicated no interest in learning more about cooking the meats included in the list, and 3 in 10 were not interested in trying new recipes. When appraising these results by the background characteristics of the homemakers, however, it is apparent that older women, women from small families, and those with relatively low education and income were least likely to express interest. This and the previous finding suggest programs of education and information would be best received by those most able to take advantage of them and by homemakers in families large enough to make varying tastes a factor.

In summary, the above results suggest that, though a gap exists between persons who tend to try new cooking methods and those who express interest, the gap could be narrowed by directing recipes toward certain segments of the population, especially recipes for meats such as ground beef and chicken.

MEAT FREEZING

Home Freezing of Fresh Meat

The great majority of respondents (87 percent) indicated they sometimes froze fresh meats at home. Although the differences were not large, the practice was somewhat less likely to be reported by homemakers who were older, less well educated, from smaller families, in the lower income bracket, or living in large cities or rural areas. (Question 68)

The few respondents who did not freeze fresh meats generally explained either that they preferred to make meat purchases in small quantities, or that they did not have a freezer. (Question 69)

Those who on occasion froze fresh meats at home gave reasons such as: it saved shopping, prevented spoilage, was convenient, or was economical. Beef, chicken, and fresh pork were the meats most likely to be cited as having been frozen at home. (Questions 69 and 70)

When asked about length of storage, homemakers who said they froze fresh meat suggested a considerable range in the amount of time such meat could be kept frozen. This may reflect in part their opinion of the adequacy of the freezing equipment available to them. The time periods mentioned varied from a week or less to 6 months or more; no one interval stood out in frequency of choice. Some homemakers (16 percent of those who froze fresh meat at home) said that the time period could vary, depending mainly on the kind of meat. (Question 71)

Two-thirds of those who reported home freezing of meat said they usually thaw the meat completely before cooking it. Most of the remainder indicated that they thawed the meat partially, or that their procedure in this respect varied with the time available or the kind or cut of meat; only 5 percent generally cooked meat frozen. Homemakers under 30 years of age were somewhat more likely than their seniors to thaw the meat completely before cooking it. (Question 72--Tabulation not shown)

Interest in Buying Already Frozen Meat

Despite the widespread acceptance of home-frozen meat, relatively few homemakers expressed interest in purchasing already frozen raw meat, and only 1 percent indicated they were doing so at the time of the interview. Respondents were asked:

"Would you or wouldn't you like to buy any raw meat already frozen--where you usually buy meat, not from a freezer plan?" (Question 65)

	<u>Percent</u>
No, I would not	79
Yes, I would	13
It depends	6
I already buy frozen meat	1

It is interesting to note that proportions opposing the idea of purchasing frozen meat were fairly uniform among all age, income, education, family size, and place-of-residence groupings. Although relatively few (15 percent) of the homemakers uninterested in buying already frozen meat complained explicitly about visual handicaps this process would pose, much the same idea was expressed by nearly half these women in citing lack of standards for judging such meats. Specifically, they indicated they would not be able to determine how long the meat had been frozen before purchase and would not be able to judge its quality. Some mention was also made of possible taste deterioration with freezing. (Question 66)

The "dependent" factor most often mentioned was the quality of the meat before freezing, i.e., assurance of "good meat" would be a deciding factor in purchasing meat in this form. A substantial percentage of the "dependers" (20 percent) indicated interest only in buying prefrozen poultry, some types of which are already well established at the consumer level. About 1 in 10 also mentioned such factors as the store's reputation, how long the meat would be frozen (shelf life), and price. (Question 66)

Four out of 10 who expressed an interest in purchasing already frozen meat felt that this would provide a convenient, ready-to-use item for them; roughly 2 in 10 felt that the meat would be fresher at the time of purchase or would stay fresher after it was purchased. (Question 66)

Among those who said they would welcome the opportunity to purchase already frozen meat, interest was expressed particularly in purchasing frozen beef (mainly ground beef and steak) and chicken. Pork was also mentioned, but only about half as often. (Question 67)

INSPECTION AND GRADING

Awareness of Inspection and Grading

Most respondents stated that the meat they buy is inspected and that beef is graded. However, about half said they thought pork is also graded--which is not true at the retail level--while almost the same proportion were unwilling to make any statement on this matter.

Respondents were asked:

"As far as you know, is the meat you buy inspected, or isn't it?" (Question 33)

"As far as you know, is pork graded or not?"

(Question 37)

"As far as you know, is beef graded or not?"

(Question 38)

Replies	Is the meat you buy <u>inspected?</u>	Is beef graded?	Is pork graded?
<u>Percent</u>			
Yes, it is	93	86	48
No, it is not	*	*	6
Don't know, other...:	7	14	46
Total	100	100	100

*Less than 1 percent

Respondents with less education and lower incomes were not as likely to express an opinion about whether beef is graded. These homemakers were also less inclined to express opinions about whether pork is graded or the meats they buy are inspected, but the differences were not as large. 4/

Responsibility for Inspection and Grading

Homemakers who said that the meat they buy is inspected were asked:

"Who does this inspection of meat?" (Question 35)

Those who said that beef is graded were asked:

"Who does this grading of beef?" (Question 40)

4/These results should be interpreted with caution. Homemakers at lower education and income levels were less inclined than their counterparts to express opinions on several of the questions in this study. This was noticed to some extent for the questions just discussed. Even more striking are "no opinion" responses given by these respondents to some of the inspection and grading questions that follow. For instance, when asked who inspects meat, they were more than twice as likely as those in the highest income and education categories to refrain from commenting. In some instances the oldest and youngest age groups were also less likely to express opinions--related perhaps to lower education and income on the part of older women and to relative lack of experience as homemakers on the part of younger women. Previous SRS studies of this kind indicate that this unresponsiveness is not unusual. It is problematical whether true differences are being recorded among segments of the population or whether some groups express themselves more readily than others; it may be a combination of the two.

More than half of the homemakers who were asked these questions indicated that inspection and grading were functions of the Federal Government, with the U.S. Department of Agriculture specifically cited as the responsible agency by almost 3 out of 10 respondents answering these questions.

	<u>Inspection</u>	<u>Beef grading</u>
- - - - <u>Percent</u> - - -		
U.S. Government	42	33
U.S. Department of Agriculture	29	28
State government	8	5
Government (not further specified)	7	6
Store or market	4	7
Packer	4	9
Don't know	18	22
- - - - <u>Number</u> - - -		
Respondents who said meat is inspected or beef is graded	2,876	2,655

The tendency to express both an opinion and to name USDA in response to these questions increased with higher education and income, and decreased somewhat for those 60 years or older.

Determinants of Inspection or Grading

The vast majority of homemakers who believed that meat is inspected or beef graded referred to a stamp or label as their method for determining that these functions had been performed. Mentions of such a stamp generally included its location (primarily on the meat itself) or a description.

Some homemakers indicated that they relied on the reputation of the store or butcher as assurance that inspection had taken place, while only a few said they relied on their own judgment as a criterion. However, women tended to refer somewhat more often to their own ability to determine that grading had been performed than they did when mentioning determinants of inspection.
(Questions 34 and 39)

	<u>Inspection</u>	<u>Beef grading</u>
	<u>Percent</u>	
<u>Stamp or label</u>	90	79
Stamp on meat	49	30
Government stamp or seal	30	18
Purple or blue stamp	27	43
Grade name on stamp	5	23
<u>Reputation of store or butcher</u>	11	5
<u>Own ability to tell</u>	2	14
	<u>Number</u>	
Respondents who said meat is inspected or beef is graded	2,876	2,655

About one-third of those believing these functions take place described a stamp or label and mentioned its location. Those who didn't mention both a location and a description were more likely to mention location than description when referring to inspection; the opposite was true for beef grading.

	<u>Inspection</u>	<u>Beef grading</u>
	<u>Percent</u>	
Homemakers who mentioned:		
Stamp location and description	34	31
Stamp location only	26	10
Stamp description only	17	32
Nonspecific stamp references	13	6
Other references, Don't know	10	21
	<u>Number</u>	
Respondents who said meat is inspected or beef is graded	2,876	2,655

Meanings of Inspection and Grading

Evidence of the confusion which exists between inspection and grading was supplied by homemakers' explanations of their understanding of these functions. Homemakers who said that the meat they buy is inspected were asked what inspection meant to them. (Question 36) A similar question was asked of those who indicated that beef is graded. (Question 41)

Based on interpretation of whether or not consumers' replies to these questions indicated they had a general understanding of the functions, it appears that about half of the homemakers correctly associated ideas related to wholesomeness with inspection and to quality with grading. Another 2 or 3 respondents in 10 mentioned ideas correctly related to each concept, but these homemakers either mixed in ideas pertaining to quality when referring to inspection, and vice versa, or mentioned ideas not related to either concept. Most of the remainder were entirely wrong by either mixing up the two concepts or by mentioning functions not related to either. When these last two groups are combined, between 4 and 5 in 10 were either partially or totally incorrect concerning the functions of inspection and grading.

	<u>Inspection</u>	<u>Beef grading</u>		
	<u>Percent</u>			
 Respondents' mentions of beef grading and meat inspection were:				
Entirely correct	47	54		
Correct and incorrect	31	23		
Entirely incorrect	18	16		
Don't know, doesn't mean anything, other	4	7		
 - - - - <u>Number</u> - - - -				
Respondents who said meat is inspected or beef is graded	2,876	2,655		

Regarding the quality of responses to each question, respondents were better able to pinpoint inspection with specific mentions (meat is wholesome, fit for consumption, etc.) than they were grading. As a matter of fact, non-specific references to quality characteristics for grading outnumbered specific references by more than 2 to 1.

There is little question, in view of the data just presented, that many homemakers are indeed confused about the functions and scope of inspection and grading. For those who were either partially or totally incorrect in their

understanding of these services, questions arise about the sources of this misunderstanding. Is it a matter of assumptions which have no factual basis ("If beef is graded, pork must be also"); is it one of possible unclear or overlapping information--such as the way both the Federal Government and some stores or packers designate that meats are inspected and graded; or is it a combination of the two?

Familiarity with USDA Beef Grade Designations

Confusion was also evident about the range of names authorized by the U.S. Department of Agriculture to designate various grades of beef. Respondents who said they were aware of beef grading were presented with a card (Card D) listing five correct grade names (USDA Prime to USDA Commercial) and five spurious grade names (USDA #1, #2, Grade A, AA, First Cut). The spurious names were mixed with the correct grade names, and the latter were in neither ascending nor descending order.

From this list only 2 homemakers in 10 chose one or more correct grade designations and none of the spurious designations, while better than 6 in 10 named both correct and spurious grade designations. Among correct grade designations, the two most frequently mentioned were USDA Choice and USDA Prime. The most frequently mentioned spurious grade was USDA Grade A, which was named almost as often as USDA Prime. The question read:

"Here is a list of grade labels for beef that might be used in some parts of the country. Are there any on this list that you have seen or heard of?" (Question 42)

<u>Replies:</u>	<u>Percent</u>
Both true and spurious grade names	65
Correct grade names only	21
Spurious grade names only	6
Don't know, none of them	8

<u>Grade names selected</u>	
USDA Choice	76
USDA Prime	68
USDA Grade A	62
USDA Good	28
USDA First Cut	24
USDA Standard	18
USDA Grade AA	16
USDA Commercial	12
USDA #1	8
USDA #2	5

	<u>Number</u>
Respondents who said beef is graded	2,655

Background characteristics appeared related to knowledge of grade designations. First of all, women at the lower education level were less likely to indicate specific grade names, and when they did mention grade names, they were less likely to be correct. Younger homemakers were more likely to mention both correct and incorrect designations.

When specific grade name mentions were considered, correct designations--especially USDA Choice and USDA Prime--were more likely to be mentioned by homemakers with higher education and income. Older women were less likely to mention USDA Choice and USDA Prime as familiar designations, and were more likely to mention USDA Grade A. Northeasterners were less likely to mention USDA Good, while they were more likely than others--especially westerners--to mention USDA First Cut.

Homemakers who named more than one grade designation of beef generally selected USDA Prime as representing the highest grade of beef.

Respondents naming more than one grade were asked:

"Of the grades of beef you mentioned, which is the top grade?" (Question 43)

	<u>Percent</u>
USDA Prime	51
USDA Choice	22
USDA Grade A	14
USDA Grade AA	5
All other correct grade names	1
All other spurious grade names	2
Don't know	5

	<u>Number</u>
Respondents who named more than one grade of beef	2,267

As education and income level rose, so did the proportion of correct responses--in this case, USDA Prime. Women at lower education and income levels, on the other hand, were somewhat more inclined to credit USDA Grade A.

One might reasonably expect that among those claiming that USDA Grade A or USDA Choice was the top grade, relatively few would recognize USDA Prime as a familiar grade name. Such was not the case. The following table shows additional grade names mentioned by those who indicated either USDA Prime, USDA Choice, or USDA Grade A--the three names most often chosen--as the top grade.

Other grade names	:	Top grade selected is:		
considered familiar	:	:		
	USDA Grade A	:	USDA Choice	:
		:		USDA Prime
		<u>Percent</u>		
		:		
USDA Prime	:	51	57	x
USDA Choice	:	72	x	89
USDA Good	:	16	38	37
USDA Standard	:	19	19	23
USDA Commercial	:	5	11	20
USDA Grade A	:	x	68	60
USDA Grade AA	:	11	13	16
USDA #1	:	7	9	9
USDA #2	:	4	5	6
USDA First Cut	:	33	23	25
	:			
		<u>Number</u>		
		:		
Respondents who selected :				
USDA Grade A, Choice, or:				
Prime as top grade	:	326	504	1150
	:			

At least half of those who selected Grade A or Choice as the top grade indicated familiarity with the name USDA Prime. Most of the large number of women who selected USDA Prime as the highest grade were also familiar with the name USDA Choice. Some confusion, however, apparently exists even among these respondents. Six out of 10 of those who selected USDA Prime as the top grade mentioned familiarity with USDA Grade A--a spurious grade designation. Also, in expressing familiarity with such spurious designations as USDA Grade AA, #1, #2, or First Cut, homemakers selecting Prime as the top grade were about as inaccurate as those who named Choice or Grade A as the top.

SOME FACTORS AFFECTING THE USE OF MEATS

This section explores possible explanations underlying consumer preferences that contribute to meat usage patterns. The research technique was one of aided recall in which a list of attributes and, later, a list of situations were presented to respondents. From these lists the homemakers could choose descriptive phrases indicating their opinions about the various meats. The aided recall technique is effective in studies of this kind because people often experience difficulty in trying to remember or articulate the many ideas they may have about a particular subject or product.

Importance of Selected Characteristics in Meat Purchasing

Respondents were presented with a card listing 14 pairs of attributes that may apply to some meats; each pair consisted of the attribute stated both positively and negatively. Precautions were taken in presentation to ensure against introducing a position bias by using two forms with different sequences for this listing. A description of the precautions can be found in the appendix.

All respondents were asked first to select those characteristics they thought appropriate to beef, ham or picnics, pork, and chicken. These findings are discussed on page 30. But to properly evaluate the meats as respondents "saw" them, a frame of reference--the relative importance attributed to these ideas by respondents when considering which meats to buy--was provided.

After the respondents had characterized their images of each meat, they were asked:

"Which of these ideas are especially important to you
when you are considering which meats to buy?"
(Question 32)

The following list shows the 14 pairs of ideas--worded favorably and unfavorably--that were presented to respondents (Card C).

Easy to digest	---- Hard to digest
Not sure of good quality	---- Sure of good quality
Does not keep well before cooking	---- Keeps well before cooking
Don't get tired of	---- Get tired of
High in cholesterol	---- Low in cholesterol
Good to eat cold	---- Not good to eat cold
Many different ways to cook	---- Not many different ways to cook
Low in protein	---- High in protein
Not too much waste	---- Too much waste
High in vitamins and minerals	---- Low in vitamins and minerals
Not tasty	---- Tasty
Always safe to eat	---- Not always safe to eat
Not good for people who are watching their weight	---- Good for people who are watching their weight
Healthful to eat	---- Not healthful to eat

The intent of this question was to gain some insight into factors that might influence the purchase of meat in general. The possibility exists, however, that some respondents, in answering this question, may have been thinking of specific kinds, cuts, or brands of meat.

Care was taken to ensure that no pattern of categories would emerge from looking at the list. For instance, the several ideas related to the healthful aspects of meat were separated by other ideas so that respondents would not think attention was being concentrated on health considerations. This was the only stipulation in constructing an otherwise arbitrary order of items.

Respondents could select as many of the positive or negative alternatives as they wished. Generally, negative characteristics were not selected in response to this question and are not presented in this discussion. For reporting convenience, summary phrases are frequently used to discuss the items included.

Even though a particular attribute was not selected by a large percentage of homemakers as especially important, it does not necessarily follow that the attribute is of no interest to respondents. It may be that it was simply taken for granted. An example is the statement "always safe to eat," which was not reported as especially important by a large percentage of respondents. It is likely that this occurred because people assume the meats they are accustomed to purchasing are safe. Any event, such as an outbreak of food poisoning, that would alter this opinion would probably cause this idea to be mentioned much more frequently. However, the fact that these results should not be interpreted literally does not diminish their value, since the assumptions consumers make are of interest in an assessment of attitudes. With these cautions in mind, the results are presented below.

Assurance of good quality was the single most important purchase consideration, according to the homemakers interviewed. Since meat generally is the most expensive item in the family food budget, it is not surprising that more homemakers singled out this characteristic than any other. Other characteristics considered by homemakers to be especially important meat purchase determinants, having been selected by half or more of all respondents, are flavor, minimal waste, and healthfulness.

"Most important" attributes

	<u>Percent</u>
Sure of good quality	64
Tasty	55
Not too much waste	49
Healthful to eat	49

A second group of considerations, which may be designated moderately important, were selected by roughly 2 to 4 respondents in 10. This group adds the dimensions of versatility and keeping qualities to the characteristics already described. The other statements in this group are health related.

"Moderately important" attributes

	<u>Percent</u>
Many different ways to cook	39
Easy to digest	38
Always safe to eat	36
Don't get tired of	33
Keeps well before cooking	32
High in protein	26
High in vitamins and minerals	23

The three remaining characteristics were cited by relatively few homemakers. One of them, suitability for cold meals, perhaps may be considered a bonus--rather than a prime mover--in the purchase decision. The others relate to health considerations which are likely to be meaningful to most people only in the presence or threat of a specific health problem--namely, need to control weight or cholesterol intake.

"Least important" attributes

	<u>Percent</u>
Good for people who are watching their weight	20
Good to eat cold	18
Low in cholesterol	12

Looking at responses in terms of homemakers' characteristics reveals some interesting findings. For instance, among the four attributes considered most important in the purchase decision, there was remarkably little differentiation among the various respondent groupings. Slight exceptions occurred when homemakers considered assurance of good quality. Women at lower education and income levels were somewhat less inclined than others to indicate this idea

was especially important. Another exception concerns southern homemakers. For some inexplicable reason, these women were slightly more inclined than those from other regions to emphasize such ideas as tastiness, amount of waste, and healthfulness.

Among those attributes assigned to the moderately important group, several appeared to be related to homemakers' characteristics. The more notable relationships included versatility and digestibility with age, and amount of protein with education. Younger homemakers, perhaps because they may be more inclined to experiment, tended to emphasize the importance of versatility in meats, while older homemakers expressed more concern than younger women about the digestibility of meat. Better educated women--who generally appeared to be more oriented toward the nutritional aspects of meat--were more likely than others to indicate that amount of protein in meat was particularly important. Once again, southerners appeared to be more vocal than others in selecting meat attributes important to them.

Differences among respondents concerning the relatively "unimportant" characteristics tended to be minimal.

Characteristics of Beef, Chicken, Ham or Picnics, and Fresh Pork

As reported above, before respondents were asked to indicate which of the ideas in the 14 pairs of statements presented to them were important in meat purchasing, they had been handed a card and told:

"This card (Card C) has some phrases on it which some people think are true about certain meats. Which of these describe your opinions about beef? Any others?"
(Question 28)

This was followed by similar questions about ham (or picnics), pork, and chicken. (Questions 29-31) All respondents were asked to characterize each of the four meats regardless of whether or not that meat had been reported served in the household during the past 12 months.

In reviewing the results of this series of questions, the reader should keep in mind some important considerations. It is difficult to assess the degree of objectivity a homemaker employed in assigning statements to each meat. For instance, is the particular meat characterized actually easy to digest or did the homemaker assign an attribute to it that may have no factual basis because of her generally favorable attitude toward this meat? It is highly likely that there is a great deal of interaction between the two. The reader is, therefore, cautioned against assuming any cause-and-effect relationship on the basis of this series of questions.

These data, which are reported in the table on page 32, can be analyzed in a number of ways. If, for the favorable image statements, "general agreement" is defined as selection by 6 or more respondents in 10, then beef is characterized by homemakers as tasty, easy to digest, healthful to eat, a meat which can be cooked many different ways, which one does not tire of, and without too much waste--six favorable statements in all.

Using the same definition for chicken, there was general agreement among the homemakers on four of the statements: tasty, easy to digest, versatile in ways to cook, and good to eat cold. The majority of homemakers ascribed only two favorable characteristics to ham: good to eat cold and tasty. Fresh pork qualified on only one favorable consideration--it was viewed as tasty by the majority of homemakers.

Since overall the unfavorable image statements were chosen far less frequently than the favorable ones, a less rigorous definition is required for "relatively frequent mention." If selection by 3 or more homemakers in 10 is set as the dividing line, none of the unfavorable statements was chosen very often for beef or for chicken, and only two--tiresomeness and nonsuitability for weight watching--were associated with ham. However, many homemakers criticized fresh pork on the following seven points: digestibility, weight watching, safety in eating, keeping qualities, waste, appeal when cold, and cholesterol level. And if the criterion is lowered to selection by about 2 homemakers in 10, beef is still not faulted by many homemakers on any of the characteristics, while chicken is criticized only for not keeping well before cooking and for being a meat one tires of. In contrast, ham is faulted on digestibility, cholesterol level, versatility, and amount of waste, in addition to the two unfavorable characteristics already mentioned (tiresomeness and unsuitability for weight watching). With the lower criterion, pork proves vulnerable on most of the statements, with four more--tiresomeness, lack of versatility, quality uncertainty, and nonhealthfulness--added.

Looking at the data another way, substantially higher proportions of respondents chose the favorable alternatives for beef over the unfavorable. This was also true for chicken on all but one of the statements (keeps well before cooking), but ham and pork did not fare as well. The margins in favor of ham were comfortable for some of the items, such as flavor, appetite appeal when cold, and keeping qualities before cooking. However, the favorable alternative was selected for ham by only a slim margin (10 percentage points or less) on versatility and digestibility; tiresomeness was a tossup, and the unfavorable statement was associated with ham with much greater frequency than the favorable one on suitability for weight watchers and cholesterol level. For pork, the favorable margin was a comfortable one on only one factor--tastiness--and favorable responses held a slim edge on the topics of quality, healthfulness, and versatility. Once again, tiresomeness was a tossup, and negative reactions to pork outscored positive ones somewhat on the subjects of eating cold, amount of waste, and keeping qualities before cooking. The unfavorable alternative was chosen for pork by a substantial margin on digestibility, eating safety, suitability for weight watchers, and cholesterol levels.

As might be inferred from these findings, more homemakers generally selected the favorable statements and fewer chose the unfavorable statements for beef than for the other three meats. Chicken usually ran a close second, with ham next and pork trailing. However, there were two noteworthy exceptions: ham outscored chicken on the issue of keeping well before cooking, and both chicken and ham ranked above beef as good to eat cold.

Characteristics that homemakers associate with specific meats:

Characteristics	Beef	Chicken	Ham (or picnics)	Pork
<u>Percent</u>				
Sure of good quality	47	41	32	25
Not sure of good quality	7	10	12	19
Tasty	78	74	63	59
Not tasty	1	2	3	4

Not good to eat cold	15	8	5	31
Low in cholesterol	21	21	3	2
High in cholesterol	7	4	23	30
Total favorable mentions	783	663	451	308
Total unfavorable mentions ...:	63	108	210	345

*Less than 1 percent.

As mentioned earlier, the purchase considerations most often said to be important by respondents related to quality, flavor, healthfulness, and waste. All four meats were said to be tasty by at least as many homemakers as indicated that tastiness was an important purchase consideration. Both beef and chicken were characterized as healthful and without too much waste by at least as many homemakers as said these were important qualities; ham and pork scored lower. It is particularly striking, however, that all four meats were said to be of consistently good quality by far fewer homemakers than those who said they considered this attribute important in the purchase decision. Apparently many homemakers lack confidence or knowledge about the measures being taken to provide them with meats of consistent and recognizable quality.

Beef and chicken generally fared well on the remaining characteristics, but for the most part, higher proportions of respondents considered these ideas important than considered them characteristic of ham or pork. The main exceptions to this pattern were with reference to food value and suitability for a cold meal, and to ham's keeping qualities.

The following tabulation, based on the total favorable and unfavorable statements respondents assigned to each meat, provides a summary of the comparative standings of these meats.

	Average number of choices for each meat			
	<u>Beef</u>	<u>Chicken</u>	<u>Ham</u>	<u>Pork</u>
Favorable	7.8	6.6	4.5	3.1
No choice	5.6	6.3	7.4	7.5
Unfavorable6	1.1	2.1	3.4
Total	14.0	14.0	14.0	14.0

On the average, beef drew about 8 of the 14 possible favorable comments from each homemaker, while fresh pork drew only 3 of 14. Although statements about ham and pork--either favorable or unfavorable--tended to be disregarded, these meats (especially pork) were still criticized substantially more often than either beef or chicken.

When homemakers' opinions of each of these four meats are analyzed by the frequency with which each meat was reportedly used, the caution against concluding which is cause and which is effect must again be carefully observed. In other words, one cannot be sure whether a particular level of meat usage is caused by specific feelings toward that meat or whether opinions about the meat stem from or are reinforced by its frequency of usage. It is probably safe to say that a good deal of interaction occurs between the two.

Beef was still generally well regarded by homemakers whether they represented a household with a higher usage level (beef served two or more times a week) or a lower usage level. At the lower usage level, however, the percentage of homemakers selecting favorable statements about beef decreased somewhat. This was particularly noticeable regarding the concept of tiresomeness.

On the other hand, homemakers' characterization of chicken did not tend to vary to any great extent between higher usage (once a week or more) and lower usage. There was one exception: as with beef, lower level users mentioned less often that they didn't tire of chicken.

Frequency of usage did not appear to be related to the majority of characteristics ascribed to ham and pork. Nevertheless, as with beef and chicken, the less frequently homemakers reported serving ham or pork, the more likely they were to say they "get tired of" these meats. Lower usage level homemakers (less than once a month for ham and once a month or less for pork) were also more critical of these meats regarding waste and were less likely to comment favorably on their versatility and their overall healthfulness. Furthermore, fewer infrequent users of fresh pork than other users were favorably inclined toward this meat on the basis of tastiness and digestibility.

In most instances, nonusers of ham and pork were less likely than users at any level to ascribe favorable characteristics to these meats. Nonusers, however, were also generally less likely than users (especially lower level users) to mention ham and pork unfavorably. The only notable exception was a negative reaction to the overall healthfulness of the meats, more so for pork than for ham. This feeling toward pork (expressed by both lower level users and by nonusers) could represent a real barrier to increased consumption or to any consumption at all.

When the data for all four meats were examined in terms of respondents' personal characteristics, it was observed that, although homemakers tended to agree about assurance of quality, there was more divergence of opinion for the other attributes than had been noted when deciding which meats to buy.

Educational level, in particular, was related to many of the opinions homemakers expressed about these meats, especially opinions concerning health qualities. As educational level increased, women were generally more likely to say all four meats were healthful to eat, and high in proteins and in vitamins and minerals. As a matter of fact, these homemakers were as likely to indicate ham and pork were nutritious as they were chicken. On the other hand, better educated homemakers, more often than their counterparts, tended to view both ham and pork as high in cholesterol and as meats unsuitable for weight watching; beef and chicken fared much better on those attributes. Since, as found previously, better educated women appeared to show more concern for the healthful aspects of meat, positive results may be gained by information and educational programs directed at these women with regard to these attitudes toward ham and pork.

Better educated women were also more favorable to all but fresh pork as good meats to eat cold; to beef and chicken for versatility; to chicken and ham for keeping qualities; to ham and pork for waste; and, to some extent, to pork for safety.

Opinions by income level paralleled those by education level, although generally the differences were not as sharp. Beef was additionally favored by these women from the standpoint of tiresomeness, tastiness, and weight watching. Fresh pork tended to be criticized less often for overall healthfulness by upper income homemakers than those at lower levels.

Age of the respondents appeared to be related to some of the opinions held of these meats, especially with regard to digestibility. Older homemakers were more likely to reject fresh pork and ham as easily digestible meats; in turn, they were somewhat more likely than younger women to indicate approval of beef and chicken as digestible meats. Concerning overall healthfulness, younger women were relatively more favorable to ham and pork than were older women. Another finding pertained to the "fatigue" factor of fresh pork: homemakers under 30 were somewhat more likely than their seniors to view pork as a meat one does not tire of. These younger homemakers, however, were least likely to indicate pork was good to eat cold.

Regional differences in opinions of these meats were also evident. Homemakers in the Northeast were least likely to mention either positive or negative statements for ham and fresh pork. Homemakers in the South, on the other hand, were more inclined to comment on these meats--especially ham--both favorably and unfavorably.

Westerners tended to view ham more favorably on tastiness and amount of waste than homemakers from other regions. Westerners also least faulted fresh pork on difficulty of digestion. Generally, chicken was regarded somewhat more favorably by southerners than others. The chief exception was that these homemakers were less likely than others to indicate that chicken was good to eat cold.

Suitability of Selected Cuts for Specific Circumstances

Another method of determining opinions which could be useful in understanding meat purchasing behavior was incorporated into a series of questions designed to investigate the suitability homemakers assign to serving specific meat cuts under selected circumstances.

Respondents were presented with a card (Card E) listing the following meats:

A pot roast of beef--one that is generally cooked in a covered pot	Chicken
An oven roast of beef--one that is generally cooked in the oven	Lamb
	Ham or picnic
	Pork roast

Steak (beef such as sirloin, T-bone, ribsteak, or round steak)	Pork chops
	Spareribs
Ground beef	
Stew beef	Wieners, franks, hot dogs

It can be seen from the above list that beef and fresh pork are listed by various cuts while the other meats are not. This was done, first of all, because the emphasis of this study is on beef and pork; and, second, the cuts within each meat were thought to be different enough from each other to stimulate different responses according to the situation being considered.

Five situations were presented in this series of questions. The first question read:

"There are meats which some people would serve at the main meal for certain situations, and other meats which they would NOT serve for these situations. Which of these meats do you think would be especially good for a warm weather meal for your family? Any others?"

"Which do you think would NOT be especially good for a warm weather meal for your family? Any others?"
(Questions 47 and 48)

The series continued by asking which of the meats would be especially good and which would NOT be especially good under the following circumstances:

"...if you want to serve an inexpensive meal?"
(Questions 49 and 50)

"...if you want to serve an easy-to-prepare meal?"
(Questions 51 and 52)

"...when special guests are coming to eat?"
(Questions 53 and 54)

"...when you are not sure which meats your guests like?"
(Questions 55 and 56)

Respondents were encouraged to name as many meats as they wished by the probe, "Any others?"

Each of the circumstances named in this series of questions was designed to represent specific needs which might influence meat purchase practices. For example, Questions 47 and 48 measured possible seasonal variations in meat preferences either because of characteristics of the meat itself or because of

the kind of preparation required. Questions 53 and 54 were directed at evidences of the prestige or lack of prestige of specific meats, and Questions 55 and 56 were directed at determining the breadth of appeal of specific meats.

A study of those meats that were most (or least) favored for each situation out of all the meats presented in the list revealed the following: the majority of homemakers agreed that, for warm weather meals, chicken, ground beef, steak, and wieners were especially good, while pork roast was not. For inexpensive meals, ground beef, chicken, and wieners were favored, while steak was rejected. An oven roast of beef and steak were considered especially good to serve to special guests, while wieners were understandably viewed with disfavor for such circumstances. Ground beef and wieners headed the list of meats that are easy to prepare. A beef oven roast was the leading choice for guests whose preferences are not known, while lamb was considered undesirable in this situation.

The percentages of homemakers who named each meat as especially good or not especially good for each situation are presented below.

Homemakers' reactions to specific meats for use in selected situations:

Meat	: Warm weather	: Inexpensive	: Easy to prepare	: Special guests	: Not sure of guests' preferences
	: Good	: Not good	: Not good	: Not good	: Not good
Percent					
:					
Pot roast	15	29	15	16	17
Oven roast	18	38	5	44	24
Steak	53	3	2	81	32
Ground beef	57	2	69	1	56
Stew beef	7	33	23	4	10
Chicken	64	2	60	1	33

Pork chops	10	36	2	24	17
Spareribs	10	31	6	13	5
Wieners, franks, hot dogs	54	3	47	2	53
:					

Following is an analysis of homemakers' answers to the above series of questions, concentrating on the four kinds of meat on which this study focused.

Beef

Perhaps an explanation of the high regard in which beef is held by homemakers lies in part in the fact that, for all of the circumstances cited, some type of beef was considered especially good by a substantial proportion of women. For prestige and universality of appeal, homemakers selected oven roast and steak, although homemakers tended to characterize these meats--especially steak--as unsuitable for an inexpensive meal. For economy and ease of preparation, most homemakers named ground beef, with ground beef and steak favorably considered for a warm weather meal. Although few homemakers found stew beef and pot roast desirable for most situations, the majority of homemakers did not reject either of these meats for any of the circumstances mentioned.

When opinions of the various types of beef are viewed by background characteristics, it is not surprising that higher income and better educated homemakers--relatively more often than their counterparts--named steak and oven roasts as especially good for most of the given situations. Younger homemakers did not rate oven roasts or pot roasts high for warm weather meals, compared with their elders, and they were more likely to reject ground beef for special guests. Rural residents criticized oven roast for its expensiveness more often than persons living in large metropolitan and urban areas; the former were also more likely to reject steak as an easy-to-prepare meat. Northeast residents tended to favor steak and ground beef for warm weather and easy-to-prepare meals more often than residents of the other regions. They were also most favorable to oven roasts for special guests; they were most likely to reject oven roasts, however, for inexpensive meals. Western homemakers were more often favorable to steak for wide appeal. Southern residents were less likely to favor steak and ground beef for warm weather meals, ground beef for prestige and easy meals, and oven roast for prestige meals.

When opinions about the suitability of these kinds of beef are viewed by their reported usage level, it is not surprising that the most frequent users of each meat were also most likely to regard that meat as especially good for each of the suggested situations, and nonusers were least inclined to comment favorably. For instance, fewer nonusers or relatively infrequent users favored oven roasts and steak for easy-to-prepare meals. The most striking differences, however, were between users and nonusers of these meats. Major differences were that nonusers were much less likely to consider oven roasts and steak good choices for special guests or for those whose preferences are not known, and steak was singled out as a meat that few nonusers favored for a good warm weather meal.

Chicken

Chicken was selected as suitable for a warm weather meal more often than any other meat on the list. Homemakers also tended to regard chicken as inexpensive, as a prestige meat, and one with wide appeal. Homemakers more often than not considered chicken easy to prepare, but a sizable proportion felt it was not good for this kind of meal.

Replies to this series of questions indicate that lower income homemakers were as likely to consider chicken high in prestige value as oven roast and

steak. Furthermore, more of the lower income homemakers considered chicken suitable when guests' tastes are unknown than either oven roast or steak. As the income level increased, however, higher proportions of homemakers expressed a preference for serving oven roast or steak in these circumstances. Among the meats most often considered especially good for inexpensive meals--ground beef, chicken, and wieners--chicken is the only one that did not tend to be mentioned more often as income level rose. About as many homemakers in the lower income level said that chicken is good for this type of meal as those in the middle and upper levels. Northeast and southern residents were more often favorable to chicken for ease of preparation than were residents of the North Central and Western regions.

In general, level of usage did not appear to be related to opinions about the suitability of chicken for each of the situations.

Ham or Picnics

Ham or picnics were considered good for a warm weather meal by about 4 out of 10 homemakers, as opposed to the 1 out of 10 who felt the reverse to be true. Ham or picnics were often said to be easy to prepare and good for serving to special guests. Homemakers were about equally divided on whether these meats were good to serve when guests' preferences in meats were unknown, and generally, homemakers did not consider these meats inexpensive.

Education and age appeared somewhat related to opinions about ham or picnics for a few of the situations, especially for warm weather meals. Better educated homemakers were more likely than others to find these meats good for warm weather meals. Also, homemakers aged 30 to 39 were more apt to favor ham or picnics for warm weather meals than others, especially older women.

The tendency to comment favorably on ham's suitability for a particular situation decreased somewhat as the reported usage level declined, although not for every situation. However, nonusers were much less likely than users to favor this meat for special guests and for a warm weather meal.

Fresh Pork Cuts

Fresh pork cuts included on the list drew very few favorable responses for each occasion. The highest favorable mention was for pork chops: 17 percent indicated that pork chops were good for an easy-to-prepare meal. Other favorable responses for each cut ranged from 2 to 10 percent on the various situations, while rejection of these cuts ranged from 11 to 60 percent. The most prevalent unfavorable comments on pork were for use in warm weather and for serving to guests whose preferences are not known.

For some of the situations, negative reactions to fresh pork cuts appeared to be related to age and education. In general, as age increased, so did rejection of these cuts as meats for warm weather meals. Younger women were also somewhat more likely to mention pork chops favorably as an easy-to-prepare meat. On the other hand, rejection of spareribs as an easy-to-prepare meat decreased as the homemaker's age increased. Women with a grade school

education were less likely than their college counterparts to reject pork roast for warm weather meals, spareribs for easy-to-prepare meals, and all three cuts for serving to guests with unknown preferences.

Northeast residents rejected pork roasts and chops for warm weather meals more often than did residents of the other regions. North Central residents were least likely to reject chops in this circumstance.

Opinions about the suitability of fresh pork cuts did not appear to be particularly related to their reported level of usage.

APPENDIX

Sample Design

The sample was a stratified multistage, random sample of all private households in the 48 conterminous States. In each household, the homemaker--the person chiefly responsible for either buying or preparing food for the household--was interviewed. Households in which no meats were prepared were excluded from the survey. Usable interviews were obtained from 3,099 homemakers.

The structure of the sample, with reference to the first stage sampling units (FSU's), is indicated by the following table which shows the number of first stage units in the sample by geographic areas and zones.

Geographic region and division	Zone 1	Zone 2	Zone 3	Total
: - - - - - Number - - - - -				
:				
Northeast:				
New England	2	2	2	6
Middle Atlantic ...	12	7	5	24
:				
North Central:				
East North Central:	8	6	6	20
West North Central:	2	2	6	10
:

East South Central:	2	1	4	7
West South Central:	4	1	4	9
:				
West:				
Mountain	2	1	2	5
Pacific	6	5	2	13
Total :	40	28	38	106
:				

The nine geographic areas correspond to the nine census divisions except that Maryland, Delaware, and Washington, D.C. metropolitan areas were included in the Middle Atlantic division rather than the South Atlantic. Within each of the nine divisions, three groupings or zones were used as follows:

Zone 1---That portion of a Standard Metropolitan Statistical Area (SMSA) containing one or more cities of 50,000 or more inhabitants.

Zone 2---Portions of SMSA's not included in Zone 1. These consist primarily of suburban communities but may also include rural territory within a SMSA's boundary.

Zone 3---Non-SMSA areas consisting of small towns and rural farm and nonfarm territory.

Each zone within each division was further divided, giving a total of 106 strata of approximately equal size. A primary sampling unit (PSU) in Zone 1 was a city or a major subdivision of a city, and in Zones 2 and 3 was a county or noncity portion of a county. All land area in the 48 States was assigned to a PSU, and one PSU was drawn with probability proportional to size from each of the 106 strata. Since the objective was to have each FSU contain approximately 10,000 households, the 106 selected PSU's were divided into areas, FSU's, of approximately 10,000 households. In PSU's involving cities where census tracts exist, such tracts were combined to form FSU's. In nonTRACTED areas, Census Enumeration Districts were combined to form FSU's. From each of the PSU's, one FSU was drawn, again with the probability in proportion to size.

Identification of Respondents

The 106 First Stage Units of approximately 10,000 households were divided into segments. A segment is a portion of an enumeration district in non-TRACTED areas and is a block (or blocks) in TRACTED areas. Seven hundred such segments were drawn.

A detailed map of the segments was given to each interviewer after proper instruction and she was asked to list each household in the segment. The lists were returned to the home office of the contractor. There they were subsampled and a listing of the sampled households was returned to the interviewers. The selection of segments and households within lists was made in such a way as to make the sample self-weighted.

The procedure of prelisting households and drawing the final sample in the office gave the contractor control over the selection of respondent households. Checks were made on the process of listing households.

An eligible household in this study was composed of the occupants of a dwelling unit in which cooking facilities were available and meats were served. Every sample dwelling unit was contacted and every reasonable attempt was made to determine eligibility of the household and to interview the person with

major responsibility for purchasing or preparing food. A differential call-back rule based on zone and region was used. This yielded over an 80 percent completion rate of eligible respondents within each zone and each region.

A total of 4,202 prelisted dwelling units was visited to determine eligible households for eventual interviewing. Of this number, 436 were found to be either vacant or no longer standing. Thus, 3,766 occupied households with cooking facilities were designated as part of the survey sample. Of this number, 107 were found to be households where no meals were prepared. The remaining 3,659 comprised the eligible group of sample households.

The sample design for this study encompassed the collection of data over a four-quarter (season) time period during the calendar year 1967. A systematic selection of 175 of the 700 segments was made for each of the four quarters, so that a sample of 175 different segments was used in each of the quarters. Over 750 interviews were conducted in each quarter. The segments used for the second, third, and fourth quarters were updated to reflect the area as it existed at the time of interview. Each quarter, therefore, is a self-weighting sample of the United States, and the four quarters were added together to represent a sample taken over a year's time.

Interview completion rates among eligible respondents:

Item	Eligible households in survey sample	Completed interviews of eligible households	
	Number	Number	Percent
U.S. total	3,659	3,099	84.7
Region:			
Northeast	1,088	874	80.3
North Central	1,051	909	86.5
South	968	849	87.7
West	552	467	84.6
Zone:			
City	1,367	1,112	81.3
Suburb	1,082	902	83.4
Rural	1,210	1,085	89.7
Season:			
Winter	930	776	83.4
Spring	914	782	85.6
Summer	902	778	86.3
Fall	913	763	83.6

Sampling Tolerances

To aid in interpreting results, the following table is provided to indicate the approximate magnitude of random error due to sampling.

Approximate sampling tolerances (95 in 100 confidence level)

For percentages around--	Number of interviews on which a percentage is based						
	3,099*	2,000	1,000	750	500	200	
	:	:	:	:	:	:	
<u>Percent</u>							
50	3	3	4	4	5	8	
40 or 60	3	3	4	4	5	8	
30 or 70	2	3	4	4	5	7	
20 or 80	2	3	3	3	4	6	
10 or 90	2	2	2	3	3	5	

*Size of total sample

The chances are approximately 95 in 100 that the survey result does not vary, plus or minus, by more than the indicated amount from the result that would have been obtained had the same procedures been used to interview all homemakers in the population.

For example, 40 percent of all homemakers in the survey said that beef was high in vitamins and minerals. The chances are 95 in 100 that, had all homemakers in the population been interviewed, the true percentage of those saying that beef was high in vitamins and minerals would be between 37 and 43 percent.

For subgroups of the sample, the possible variation is larger than for the total sample because the number of interviews was smaller. For instance, of the 409 respondents who said they would be interested in buying raw meat already frozen, 39 percent indicated that they would buy meat in this form because it was convenient to use. The chances are approximately 95 in 100 that if all homemakers interested in purchasing frozen meat had been interviewed, between 34 and 44 percent would have given this reason.

Image Question Rotation

Two versions of Card C--which lists meat characteristics--were used in this study, half the sample receiving one version and half the other. The only difference between the two versions of this card was that characteristics appearing in the left-hand column of one version appeared in the right-hand column of the other, and vice versa. This was done to avoid potentially biased answers caused by the order in which each of a pair of items is presented, i.e., specifically the possibility of favoring alternatives from one side of a page.

Comparison of results obtained from the two forms indicates that differences were minimal. For example, only once in the 140 comparisons (the five questions dealing with this list of items times two forms times 14 pairs of items per question) did a left-hand position differ as high as 5 percentage points from a right-hand position. The great majority of comparisons yielded either no differences or differences of 1 percentage point.

With the exception of check-box material, office record information, and free-answer space, the questionnaire used for this study is reproduced below in entirety. The cards used are reproduced at the end of the questionnaire. Responses to a few of the questions have not been reported because the data were not of value. Instructions to interviewers are in upper case letters.

Good _____, I am _____ from National Analysts, Inc., a marketing research firm in Philadelphia. We are conducting a study for the United States Department of Agriculture, all across the country to learn about people's attitudes toward some of the meats they eat. Your household has been selected to be part of this study.

1. HAND RESPONDENT CARD A. To begin with, I'd like to get some idea about the meats served in your home. As far as you can remember, which of these meats or meat products were served in the past month? RECORD TO RIGHT IN COL. A.

2. FOR EACH MEAT NOT CIRCLED IN COL. A ASK: In the past twelve months, was _____ served in your home? RECORD TO RIGHT IN COL. B. REFER TO QUESTIONS 1 AND 2: IF POT ROAST, OVEN ROAST, STEAK, OR GROUND BEEF CIRCLED "NO" IN COL. B, OMIT WHEN ASKING QUESTION 3.

3. HAND RESPONDENT CARD B. I'd like to get an idea of about how often you serve different kinds of beef. Which phrase on this card shows how often, on the average, you serve a pot roast of beef? About how often do you serve an oven roast of beef? Steak? Ground beef?

4. Considering all the various kinds of beef that you use, which phrase on this card shows how often, on the average, beef was served in your home during the past twelve months?

5. IF NOT AT ALL IN PAST 12 MONTHS IN QUESTION 4--Why do you suppose beef is NOT served in your home? What other disadvantages? NOW SKIP TO QUESTION 7.

6. IF ABOUT ONCE A MONTH, OR LESS OFTEN THAN ONCE A MONTH IN QUESTION 4--Why do you suppose beef is not served more often in your home? PROBE

7. HAND RESPONDENT CARD B. Let's talk about broiler and fryer chickens. Which phrase on this card shows how often, on the average, such CHICKEN was served in your home during the past twelve months?

8. HAND RESPONDENT CARD B. And which phrase shows how often, on the average, LAMB was served in your home during the past twelve months?

9. IF NOT AT ALL IN PAST 12 MONTHS IN QUESTION 8--Why do you suppose lamb is NOT served in your home? What other disadvantages? NOW SKIP TO QUESTION 13.

10. IF ABOUT ONCE A MONTH OR LESS OFTEN THAN ONCE A MONTH IN QUESTION 8--Why do you suppose lamb is not served more often in your home? PROBE

11. At what oven temperature do you roast lamb? IF RESPONDENT DOES NOT ROAST LAMB--SKIP TO QUESTION 13.

12. Do you usually serve roast lamb rare, medium, or well done?

13. HAND RESPONDENT CARD B. Now let's turn to bacon. Which phrase on this card shows how often, on the average, BACON was served in your home during the past twelve months?

14. IF NOT AT ALL IN PAST 12 MONTHS IN QUESTION 13--Why do you suppose bacon is NOT served in your home? What other disadvantages? IF RELIGIOUS REASON GIVEN SKIP TO QUESTION 28, OTHERWISE SKIP TO QUESTION 16.

15. IF ABOUT ONCE A MONTH OR LESS OFTEN THAN ONCE A MONTH IN QUESTION 13--Why do you suppose bacon is not served more often in your home? PROBE.

16. HAND RESPONDENT CARD B. EVERYONE, UNLESS BACON NOT SERVED FOR RELIGIOUS REASONS--Now, let's turn to other kinds of pork. Let's begin with hams and picnics -- some people call them smoked or cured pork. Which phrase shows how often, on the average, HAMS AND PICNICS were served in your home during the past twelve months? Please include all kinds of ham such as canned ham and ham steak, but NOT boiled ham which is sometimes called lunch meat.

17. IF NOT AT ALL IN PAST 12 MONTHS IN QUESTION 16--Why do you suppose hams or picnics are NOT served in your home? What other disadvantages? NOW SKIP TO QUESTION 23.

18. IF ABOUT ONCE A MONTH OR LESS OFTEN THAN ONCE A MONTH IN QUESTION 16--Why do you suppose hams or picnics are not served more often in your home? PROBE

19. HAND RESPONDENT CARD B. Let's talk about which types of hams or picnics you serve. Which phrase on this card shows how often, on the average, you serve canned ham? Other ham -- whether whole, butt or shank? Picnics?

20. At what oven temperature do you bake ham?

21. IF CANNED HAM NOT SERVED AT ALL IN PAST 12 MONTHS IN QUESTION 19, SKIP TO QUESTION 23, OTHERWISE CONTINUE. What brand of canned ham do you usually buy?

22. Is that imported or not?

23. HAND RESPONDENT CARD B. Let's talk about pork which has NOT been smoked or cured -- some people call it fresh pork. Which phrase shows how often, on the average, such PORK was served in your home during the past twelve months? Please include all pork, such as pork roast, pork chops, or fresh spareribs.

24. IF NOT AT ALL IN PAST 12 MONTHS IN QUESTION 23--Why do you suppose pork is NOT served in your home? What other disadvantages? NOW SKIP TO QUESTION 28.

25. IF ABOUT ONCE A MONTH OR LESS OFTEN THAN ONCE A MONTH IN QUESTION 23--Why do you suppose pork is not served more often in your home? PROBE

26. HAND RESPONDENT CARD B. Which phrase on this card shows how often, on the average, you serve a pork roast? Pork chops? Spareribs?

IF PORK ROAST SERVED AT ALL, ASK QUESTION 27, OTHERWISE, SKIP TO QUESTION 28.

27. At what oven temperature do you roast pork?

HAND RESPONDENT CARD C.

28. EVERYONE--This card has some phrases on it which some people think are true about certain meats. Which of these describe your opinions about beef? Any others?

29. Which of these describe your opinions about ham (or picnics)? Any others?

30. Which of these describe your opinions about pork? Any others?

31. Which describe your opinions about chicken? Any others?

32. Which of these ideas are especially important to you when you are considering which meats to buy?

33. As far as you know, is the meat you buy inspected or isn't it? IF YES, IT IS--CONTINUE. IF NO, IT ISN'T; DON'T KNOW; OR RAISE OWN MEAT DO NOT BUY--SKIP TO QUESTION 37.

34. How can you tell that meat has been inspected?

35. Who does this inspection of meat? IF "GOVERNMENT," PROBE FOR WHICH GOVERNMENT.

36. What does this inspection mean to you? IF MORE THAN ONE IN QUESTION 35, SPECIFY U.S. OR USDA IF MENTIONED--What does this (U.S. government) (USDA) inspection mean to you?

37. EVERYONE--As far as you know, is pork graded or not?

38. EVERYONE--And, as far as you know, is BEEF graded or not? IF YES, GRADED--CONTINUE; IF NO, NOT GRADED; OTHER OR DON'T KNOW--SKIP TO QUESTION 44.

39. How can you tell that beef has been graded? IF "STAMP" OR "STAMPED," PROBE FOR DESCRIPTION--i.e., COLOR, SHAPE.

40. Who does this grading of beef? IF "GOVERNMENT," PROBE FOR WHICH GOVERNMENT.

41. What does this grading mean to you? IF MORE THAN ONE IN QUESTION 40, SPECIFY U.S. OR USDA IF MENTIONED--What does this (U.S. government) (USDA) grading mean to you?

42. HAND RESPONDENT CARD D. Here is a list of grade labels for beef that might be used in some parts of the country. Are there any on this list that you have seen or heard of?

IF RESPONDENT HAS NAMED MORE THAN ONE GRADE IN QUESTION 42, CONTINUE, OTHERWISE SKIP TO QUESTION 44.

43. Of the grades of beef you mentioned, which is the top grade?

44. EVERYONE--Let's talk more about shopping for meat. Do you buy prepackaged meat, meat that is either cut or weighed out to order, or do you buy it both ways? IF PREPACKAGED ONLY, CUT OR WEIGHED OUT TO ORDER ONLY, OR OTHER--SKIP TO QUESTION 46; BOTH--CONTINUE.

45. IF "BOTH" IN QUESTION 44--Which way do you usually buy it?

46. EVERYONE--In buying meat, do you shop for price "specials": Most of the time, some of the time, only once in a while, or never?

There are meats which some people would serve at the main meal for certain situations, and other meats which they would NOT serve for these situations. HAND RESPONDENT CARD E.

47. Which of these meats do you think would be especially good for a warm weather meal for your family? Any others?

48. Which do you think would NOT be especially good for a warm weather meat for your family? Any others?

49. Which would be especially good if you want to serve an inexpensive meal? Any others?

50. Which would NOT be especially good if you want to serve an inexpensive meal? Any others?

51. Which would be especially good if you want to serve an easy-to-prepare meal? Any others?

52. Which would NOT be especially good if you want to serve an easy-to-prepare meal? Any others?

53. Which would be especially good when special guests are coming to eat? Any others?

54. Which would NOT be especially good when special guests are coming to eat? Any others?

55. Which would be especially good when you are not sure which meats your guests like? Any others?

56. Which would NOT be especially good when you are not sure which meats your guests like? Any others?

57. Let's turn to another idea now--outdoor cooking or barbecuing. Have you done any outdoor cooking or barbecuing in the past twelve months or not? IF NO, SKIP TO QUESTION 59.

58. HAND RESPONDENT CARD F. Which of these meats do you cook outdoors?

59. EVERYONE--In the past three months, have you or have you not tried any new recipes for preparing beef, pork, chicken or any other meat? IF NO, HAVE NOT, SKIP TO QUESTION 62.

60. For what meats was that?

61. Where did you learn about these "new" recipes for meat?

HAND RESPONDENT CARD G

62. EVERYONE--Would you or would you not like to learn more about cooking any of these meats? Any others?

63. For which, if any, would you be likely to TRY new recipes? Any others?

64. And for which, if any, would you like to learn more about how to make sure you are getting good meat? Any others?

65. Let's talk a little now about freezing meat. Would you or wouldn't you like to buy any raw meat already frozen? I'm talking now about buying it where you usually buy meat, not from a freezer plan.

66. Why is that?

67. IF "YES" IN QUESTION 65--Which meats would you like to buy already frozen?

68. EVERYONE--Do you sometimes buy FRESH meat and then freeze it yourself?

69. Why is that? IF "NO" IN QUESTION 68, NOW SKIP TO QUESTION 73.

70. IF "YES" IN QUESTION 68--Do you sometimes freeze: Beef, bacon, ham or picnic, pork, lamb, chicken?

71. About how long do you think you can keep meat frozen before you should use it?

72. Do you usually cook meat FROZEN, do you PARTIALLY thaw it, or do you COMPLETELY thaw it before cooking?

73. Many people say there are things they don't like so well about meat or the way it is sold. What don't you like so well? What else? REPEAT PROBE UNTIL RESPONDENT INDICATES NO FURTHER IDEAS.

74. We have been talking about beef, bacon, hams, picnics and pork. Is there anything ELSE you don't like so well about any of these? IF "YES," -- Which? Any others? IF "YES, ALL OTHERS" or "NO, NOTHING ELSE," SKIP TO QUESTION 76.

75. FOR EACH "YES" IN QUESTION 74 -- Tell me more about that. What ELSE don't you like so well about _____?

CLASSIFICATION DATA: EVERYONE. Thank you. Now when we put together all the things people have told us, we group together the answers from people who are alike in one or more ways. In order to know into which groups to put your answers, we need to know something about you and your family.

76. First, tell me how old you are.

77. Now, please tell me the ages of all the people living and eating here starting with the oldest person, then the next oldest, and so on.

78. FOR EACH--How is the oldest--OR STATE AGE--related to you? And the next oldest? CONTINUE UNTIL ALL INDICATED. INDICATE SEX. ASK, IF NECESSARY--i.e., "COUSIN," "CHILD."

79. Was beef served in your parents' home when you were living at home with them, or not? How about ham or picnics? How about pork?

80. Now I'd like to ask you a few questions about the equipment you use. Does your oven have a temperature control or thermostat, or doesn't it?

81. Do you or don't you USUALLY use a meat thermometer when you roast meat?

82. Now some questions about yourself. What was the last grade of school you completed?

83. Are you employed either part time or full time?

84. What kind of work does the head of the household do? In what industry?

85. HAND RESPONDENT CARD H. And finally, which number shows the group which contains your total family income from all sources BEFORE taxes. Just read me the number.

Thank you for your cooperation.

CARDS USED IN THE INTERVIEWS

CARD A

Steak (beef) such as sirloin, T-bone, or ribsteak	Ready-to-serve sliced ham (lunch meat)
